  - Facebook and News Consumption
- 2 Literature Review
- 3 Empirical Strategies
  - Experimental Design
  - Data Collection
  - ITT Regression
- 4 Experimental Outcomes
  - Descriptive statistics
  - Demand for News on Social Media
  - Opinion and Attitudes
- 5 Summary

# Facebook

- The dominant social media platform
- News feed mechanism: Algorithm
- Controversies about fake news and scandals
- **Are individuals are easily influenced by news in the Facebook feed?**

# Parties in US

**Figure:** Democratic Party

**Figure:** Conservative Party

# Literature Review

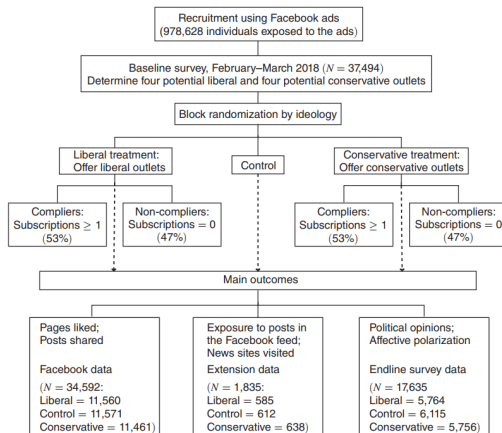

## Article Contribution

- Social media and news consumption
  - measure segregation **within** one's social media feed
  - exploit exogenous variation
- Social media and polarization
  - identify the causal effect of pro- and counter-attitudinal news
  - the first experimental evidence revealing effect of counter-attitudinal news
- media persuasion
- online media-related experiments
  - distribute news to participants in a natural setting

# Outline

- 1 Background Introduction
  - Facebook and News Consumption

**Figure:** Experimental Design Tree

# Randomization

## Treatment Assignment

- blocked by self-reported baseline ideology
  - ✓ 7-point scale
    - "I haven't thought about it much"
  - ✓ Each block has three individuals choosing the same answer
  - ✓ Subjects in same block are randomly assigned into one of three treatment groups
- Liberal Treatment
  - Offered to subscribe(like) to four potential liberal outlets
- Conservative Treatment
  - Offered to subscribe(like) to four potential conservative outlets
- control Group

# Surveys

## Self-reported Baseline Survey

- Liberal Outlets
  - *HuffPost*
  - *MSNBC*
  - *The New York Times*
  - *Slate*
- Conservative Outlets
  - *Fox News*
  - *The National Review*
  - *The wall Street Journal*
  - *The Washinton Times*

# Randomization

## Treatment Assignment

### Example for the Conservative Treatment Intervention

Following a news or media page is a great way to learn about the news and hear other perspectives. Recently, researchers have suggested that subscribing to random sources can help burst the social media echo chamber.

By clicking like below, posts from randomly chosen popular Facebook pages may start appearing in your news feed. **To expand your horizons, please click "Like Page" on 1-4 of the pages below** (Facebook may ask you to confirm the like, you can always unlike the page later).

The pages were chosen randomly and therefore may all represent views you agree or disagree with. In any case, they present an opportunity to diversify your news feed.

# Outline

- 1 Background Introduction
  - Facebook and News Consumption

  - Experimental Design
  - Data Collection**
  - ITT Regression
- 4 Experimental Outcomes
  - Descriptive statistics
  - Demand for News on Social Media
  - Opinion and Attitudes
- 5 Summary

**Figure:** Experimental Design Tree

# Data Description

Sample	Data sources	Number of participants and retention	Main outcomes
Baseline sample	Baseline survey; Facebook data on participants' subscriptions to outlets	37,494 (all participants)	Subscriptions to outlets in the intervention (compliance)
Access posts subsample	Facebook data for participants who provided permissions to access their posts and subscriptions for at least two weeks	34,592 (94 percent of participants who provided permissions in baseline)	Subscription to outlets over time; posts shared by participants
Extension subsample	Browser data for participants who installed the extension for at least two weeks	1,835 (81 percent of participants who installed the extension in baseline)	Exposure to posts in the Facebook feed; news sites visited
Endline survey subsample	Endline survey, approximately two months after baseline	17,635 (47 percent of participants who completed the baseline survey)	Political opinions; affective polarization

**Figure:** Description of main data sources

# 1 Facebook Data

- Pages liked and Posts Shared in Facebook account
- ✓ Estimate the effect of intervention on political behavior

## 2 Facebook Feed and Browsing behavior Data

- Google extension data – *Extension subsample* (for analyzing media outcomes)
  - ✓ Collect facebook feed and news-related browsing behavior
  - ✓ Estimate how often participants were exposed to posts from outlets on Facebook
- Estimate the effect on the news sites participants visited

# 3 Survey Data

## Endline Survey

- Self-reported political opinions
- Affective polarization
- Changes in self-reported news consumption habits
- *Endline survey subsample*

## 4 External Data

- 1 **Outlets:** Slant of news at the outlet level – the outlet dataset
- 2 **Comscore Browsing Data:** Descriptive statistics on news consumption outside the experimental sample –the Comscore dataset

# Outline

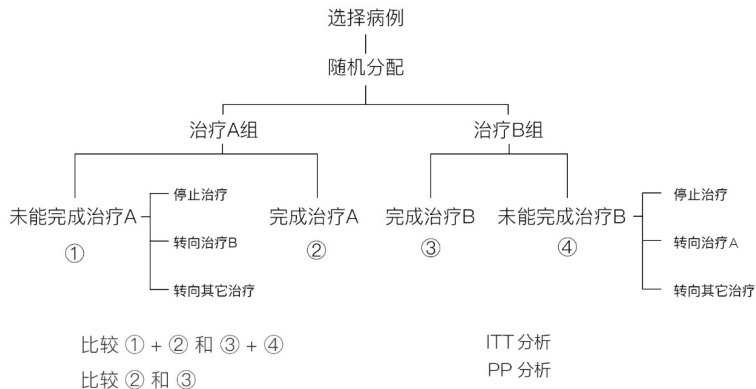

- 1 Background Introduction
  - Facebook and News Consumption
- 2 Literature Review
- 3 Empirical Strategies**
  - Experimental Design
  - Data Collection
  - **ITT Regression**
- 4 Experimental Outcomes
  - Descriptive statistics
  - Demand for News on Social Media
  - Opinion and Attitudes
- 5 Summary

# ITT estimator

- The difference between the treatment group and control group mean regardless of the degree of compliance
- Provide unbiased comparisons among the treatment groups
- Provides information about the potential effects of treatment policy rather than on the potential effects of specific treatment
- Supplementary readings:
  - ① Understanding the intention-to-treat principle in randomized controlled trials
  - ② Why ITT analysis is not always the answer for estimating treatment effects in clinical trials
  - ③ Estimating Program Effects on Program Participants

# ITT estimator

**Figure:** An example illustration of ITT and PP effect

# Liberal and Conservative Treatment

## ITT Regression

$$Y_i = \beta_1 T_i^L + \beta_2 T_i^C + \alpha X_i + \varepsilon_i$$

- $Y_i$ 
  - ① The number of times participants engaged with the *potential* outlets(four) –direct effect of the experiment
  - ② The mean slant of all leading news outlets with which participants engaged
  - ③ *A congruence scale*: calculated as the mean slant of news consumed, multiplied by (1) for liberal participants
  - ④ *The share of counter-attitudinal news*: the share of news from counter-attitudinal outlets among all news from pro- and counter-attitudinal outlets

# Liberal and Conservative Treatment

## ITT Regression

$$Y_i = \beta_1 T_i^L + \beta_2 T_i^C + \alpha X_i + \varepsilon_i$$

- $Y_i$ 
  - 1 Political opinion index
  - 2 Affective polarization index

# Liberal and Conservative Treatment

## ITT Regression

$$Y_i = \beta_1 T_i^L + \beta_2 T_i^C + \alpha X_i + \varepsilon_i$$

- $T_i^L, T_i^C$ : whether participant  $i$  is assigned to the liberal or conservative treatment, respectively
- $X$ : self-reported ideology, party affiliation, approval of President Trump, ideological leaning, age, age squared, gender, and baseline questions measuring political opinions similar in endline survey
- Estimate the effect on political opinions: test whether  $\beta_1 < \beta_2$

# Pro-Attitudinal and Counter-Attitudinal Treatment

## ITT Regression

$$Y_i = \beta_1 T_i^A + \beta_2 T_i^P + \alpha X_i + \varepsilon_i$$

- $T^A$ : Whether the participant was assigned to the counter-attitudinal treatment;  $T^P$ : the opposite one
- Individual Ideological leaning
  - 1 the party they identify with or lean toward
  - 2 Self-reported ideology
  - 3 The candidate they supported in the 2016 elections
- Measure more affective polarized: test whether  $\beta_1 < \beta_2$

  - Descriptive statistics
  - Demand for News on Social Media**
  - Opinion and Attitudes
- 5 Summary

# Individuals Are Willing to Engage with Counter-Attitudinal News

- Estimate the effect of the pro- and counter-attitudinal treatments on engagement with the potential pro- and counter-attitudinal outlets
- Participants who installed the browser extension and provided permissions to access posts for at least 2 weeks
- Engagement: subscriptions, news exposure, news sites visited, and sharing behavior, two weeks following the intervention
- News is often consumed incidentally when it becomes more accessible

# Individuals Are Willing to Engage with Counter-Attitudinal News

# Individuals Are Willing to Engage with Counter-Attitudinal News

# The Social Media Feed Strongly Affects Online News Consumption

# Effects of the Conservative Treatment on Mean Slant Declines over 6 weeks but mostly remains positive and significant

Panel A. News exposure and browsing behavior

# Effects of the Conservative Treatment on Mean Slant Declines over 6 weeks but mostly remains positive and significant

- The effects of the experiment declined but remained significant for at least **12** weeks
- Alleviate concerns of experimenter effects

# Outline

- 1 Background Introduction
  - Facebook and News Consumption
- 2 Literature Review
- 3 Empirical Strategies
  - Experimental Design
  - Data Collection
  - ITT Regression
- 4 Experimental Outcomes**
  - Descriptive statistics
  - Demand for News on Social Media
  - Opinion and Attitudes**
- 5 Summary

# Social Media News Exposure Does Not Strongly Affect Political Opinions

- The treatments did not affect the political opinions index

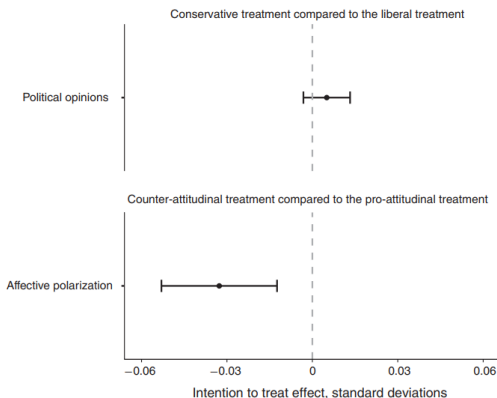

# The Social Media Feed Strongly Affects Online News Consumption

(a) Effect on Political Opinions, by Subsample

	(1)	(2)	(3)	(4)
Liberal Treatment	-0.006 (0.005)	-0.007 (0.005)	-0.011 (0.018)	-0.020 (0.019)
Conservative Treatment	-0.001 (0.005)	-0.003 (0.005)	0.002 (0.018)	-0.001 (0.018)
Conservative Treat - Lib. Treat	0.005 (0.005)	0.004 (0.005)	0.013 (0.018)	0.018 (0.018)
Controls	X	X	X	X
Sample	Endline	Endline+ Posts	Endline+ Ext	Endline+ Posts+Ext
Observations	17,635	16,339	1,286	1,196

- the counter-attitudinal treatment modestly decreased affective polarization index compared to the pro-attitudinal treatment

(b) Effect on Affective Polarization, by Subsample

	(1)	(2)	(3)	(4)
Pro-Att. Treatment	0.005 (0.012)	0.008 (0.013)	0.015 (0.044)	0.027 (0.046)
Counter-Att. Treatment	-0.028** (0.012)	-0.027** (0.013)	-0.072* (0.043)	-0.056 (0.045)
Pro-Att. Treat. - Counter-Att. Treat	0.033*** (0.012)	0.035*** (0.013)	0.087** (0.043)	0.083* (0.045)
Controls	X	X	X	X
Sample	Endline	Endline+ Posts	Endline+ Ext	Endline+ Posts+Ext
Observations	16,896	15,647	1,241	1,151

# Exposure to Pro-Attitudinal News on Social Media Increases Polarization

- Factors influencing the news individuals exposed to on social media
- Decomposes the gap between the number of posts participants were exposed to from the offered pro- and counter-attitudinal outlets

# Exposure to Pro-Attitudinal News on Social Media Increases Polarization

- The strongest force associated with participants' increased exposure to pro-attitudinal news is the **algorithm**
- Personalization is leading to segregation on social media

# Contributions

- Combine experimental variation with social media and news-related browsing data
- **News consumption on social media** is an important phenomenon because consumers are exposed to different news on social media, individuals incidentally consume news when it becomes **accessible** in their feed, and exposure to news on social media affects **attitudes**

# Brief Conclusions

- exposure to pro-attitudinal news **increases** affective polarization compared to counter-attitudinal news
- individuals are **not** easily persuaded by the political leaning of their news exposure.

# For Further Reading

- Appendix: [Social Media, News Consumption, and Polarization](#)
- Bursztyn, Leonardo, Georgy Egorov, and Stefano Fiorin. 2020. "[From Extreme to Mainstream: The Erosion of Social Norms.](#)" American Economic Review, 110 (11): 3522-48

# Brief Introduction to *From Extreme to Mainstream*

- Donald Trump's rise in popularity and eventual victory increased individuals' willingness to publicly express xenophobic views
- Individuals are sanctioned less negatively if they publicly expressed a xenophobic view in an environment where that view is more popular

## Experiment 1: Revealed Preference

## Experiment 2: Popularity of Xenophobia
